Data Analyst Interns

Day 1

Tasks

1. Installed Required Tools

I have installed the tools needed for data analytics.

A. Excel

B. Power BI

C. Python

2. Research Topic 1: Fashion E-commerce Analytics

I have understood how data analytics is used in online fashion businesses.

Fashion e-commerce means selling fashion products online, such as:

- Clothes
- Shoes
- Bags
- Accessories
- Beauty or lifestyle products

Fashion e-commerce analytics means studying data from an online fashion store to understand:

- What customers are buying
- Which products are popular
- Which products are not selling
- How customers behave on the website
- How much revenue the business is earning

- Why customers leave without buying

For example, if Raritone sells clothes online, analytics can help answer questions like:

- Which dress category sells the most?
- Which age group buys more products?
- Which city has the highest number of customers?
- Which product has the highest return rate?
- Which marketing campaign brings more sales?
- How many users visit the website but do not buy?

Why Fashion E-commerce Analytics Is Important

Fashion e-commerce analytics helps a company:

- 1. Increase sales**

- a. By finding best-selling products and promoting them more.

- 2. Understand customers**

- a. By studying customer preferences, purchase history, and browsing behavior.

- 3. Reduce cart abandonment**

- a. By identifying why users add products to cart but do not buy.

- 4. Improve inventory management**

- a. By knowing which products need more stock and which products are slow-moving.

- 5. Improve marketing**

- a. By tracking which ads, offers, or campaigns bring more customers.

- 6. Improve customer experience**

- a. By understanding what users like or dislike on the website.

3. Research Topic 2: User Engagement Metrics

User engagement metrics show how users interact with a website, app, or online store.

For a fashion e-commerce company like Raritone, user engagement means:

- How many people visit the website
- How much time they spend
- Which products they view
- How many items they add to cart
- How often they return

- Whether they complete purchases

Important User Engagement Metrics

1. Website Visits

This shows how many people visit Raritone's website or app.

If visits are high, it means many people are interested in the brand.

Example:

10,000 users visited the website in one month.

2. Page Views

This shows how many pages users open.

For example, a user may visit:

- Home page
- Men's clothing page
- Product page
- Cart page

More page views can mean users are exploring products.

3. Average Session Duration

This shows how much time users spend on the website.

Example:

Average session duration = 4 minutes

If users spend more time, they may be interested in products.

If users leave quickly, the website design, product images, or prices may need improvement.

4. Bounce Rate

Bounce rate shows the percentage of users who leave after viewing only one page.

Example:

If 100 users visit the website and 40 leave without clicking anything, bounce rate = 40%

A high bounce rate may mean:

- Website is slow
- Product images are not attractive
- Prices are too high
- Website design is confusing
- Users did not find what they wanted

5. Add-to-Cart Rate

This shows how many users add products to their cart.

Formula:

Add-to-Cart Rate = (Users who added items to cart / Total visitors) × 100

This metric helps understand product interest.

6. Cart Abandonment Rate

This shows how many users add products to cart but do not complete payment.

Formula:

Cart Abandonment Rate = (Abandoned carts / Total carts created) × 100

A high cart abandonment rate may happen because of:

- High delivery charges
- Complicated checkout process
- Lack of payment options
- No discount coupon
- Slow website
- Trust issues

7. Repeat Visitors

This shows how many users come back again to the website.

Repeat visitors are important because they show customer interest and loyalty.

4. Submission: Write 5 KPIs Raritone Should Track

You need to submit **5 KPIs**.

KPI means **Key Performance Indicator**.

A KPI is a measurable value that shows how well a business is performing.

For Raritone, the KPIs should be related to:

- Sales
- Customers
- Website traffic
- User engagement
- Retention
- Cart behavior

Final Answer You Can Submit

You can copy and submit this:

5 KPIs Raritone Should Track

1. Conversion Rate

Conversion rate measures the percentage of website visitors who complete a purchase.

It is one of the most important KPIs for a fashion e-commerce business because it shows how effectively the website converts visitors into customers.

Formula:

Conversion Rate = (Number of Orders / Total Website Visitors) × 100

For example, if 1,000 people visit Raritone's website and 50 people place an order, the conversion rate is 5%.

A higher conversion rate means the website, product pricing, product images, and checkout process are working well.

2. Average Order Value

Average Order Value measures the average amount spent by a customer in one order.

This KPI helps Raritone understand customer spending behavior.

Formula:

$$\text{Average Order Value} = \text{Total Revenue} / \text{Number of Orders}$$

For example, if Raritone earns ₹1,00,000 from 200 orders, the average order value is ₹500.

Raritone can improve this KPI by offering product bundles, discounts on minimum purchase, and personalized recommendations.

3. Cart Abandonment Rate

Cart abandonment rate measures the percentage of users who add products to the cart but do not complete the purchase.

This is very important in fashion e-commerce because many users browse products and add them to the cart but leave before payment.

Formula:

$$\text{Cart Abandonment Rate} = (\text{Abandoned Carts} / \text{Total Carts Created}) \times 100$$

A high cart abandonment rate may indicate problems such as high shipping charges, complicated checkout, limited payment options, or lack of trust.

Raritone should track this KPI to improve the checkout process and increase sales.

4. Customer Retention Rate

Customer retention rate measures the percentage of customers who return and purchase again.

This KPI shows customer loyalty and satisfaction.

Formula:

$$\text{Customer Retention Rate} = ((\text{Customers at End of Period} - \text{New Customers}) / \text{Customers at Start of Period}) \times 100$$

For a fashion brand, retaining customers is very important because loyal customers are more likely to buy again, recommend the brand, and respond to offers.

Raritone can improve retention by giving loyalty points, personalized offers, and better customer service.

5. Product Return Rate

Product return rate measures the percentage of products returned by customers after purchase.

This KPI is especially important in fashion e-commerce because customers may return products due to size issues, color mismatch, poor quality, or wrong product expectations.

Formula:

Product Return Rate = (Number of Returned Products / Number of Sold Products) × 100

A high return rate can reduce profit and increase logistics costs.

Raritone should track this KPI to improve size charts, product descriptions, product images, and quality control.

Conclusion

Raritone should track KPIs such as conversion rate, average order value, cart abandonment rate, customer retention rate, and product return rate. These KPIs will help the company understand customer behavior, improve website performance, increase sales, reduce returns, and build customer loyalty in the fashion e-commerce market.
